RAIN BY THE CUBIT
The Great Southeast Texas Flood of 1994
Llanite is found only in the vicinity of Llano, Texas. Although Llanite is an igneous rock, co-author Duane Barrett will always associate it with water!
General Timeline

- **October 15, 1994 (Saturday)**
  - Pacific Hurricane Rosa Meets a Gulf Coast Warm Front Over Texas
  - Rainfall Begins

- **October 16, 1994 (Sunday)**
  - Rainfall Abates in the Early Morning
  - Begins to Rebuild and Intensify in the Evening

- **October 17, 1994 (Monday)**
  - Large Cell Develops Southwest of Waller, Texas - Early Morning
  - Flooding Overtops U.S. Highway 290 near Waller
  - HCFCD Mobilizes Flood ALERT Activities

- **October 18, 1994 (Tuesday)**
  - Jet Stream Southward & Heavy Rainfall Comes to Harris County
  - Most Bayous and Creeks in Harris County Report Major Flooding

- **October 19, 1994 (Wednesday)**
  - Aerial Reconnaissance Conducted Across Harris County
  - The Sun Appears!
The 1994 flood affected a huge geographic area covering 38 counties in southeast Texas. The map at right illustrates the extent of the affected area, which is roughly the size of the state of Maine.
Remnants of Pacific Hurricane Rosa interacted with a warm front from the Gulf of Mexico, creating a boundary along which rainfall events were entrained.
The song “Texas Flood” by Stevie Ray Vaughan provides an appropriate musical backdrop for this amazing video created from radar images of the 1994 event.

October 15-19, 1994
Rainfall totals of over 20 inches were recorded at 4 gages within Harris County. More than 15 inches was recorded at 18 gages. Finally, more than 10 inches was recorded at 34 gages!

Rainfall Data for HCFCD Gage 1740

21 Inches of Rainfall in Less Than 24 Hours
The storm event of October 1994 produced staggering rainfall amounts, especially considering the size of the area affected.

Source: Steve Johnson, P.E.

- The average rainfall depth over the 2,880-square mile San Jacinto River watershed was **19.5 inches**.
- The 1% annual chance rainfall 4-day rainfall is **14.9 inches**.
- A total of 1.9 million acre-feet of runoff passed through Lake Houston.
- The average runoff over the watershed was **12.7 inches**.
Rainfall was heavy over the entire 38-county area affected by the storm, as evidenced by the figure at right. The area affected measures roughly 300 miles x 170 miles.
In response to the heavy rainfall over their respective watersheds, water levels in Lakes Conroe, Houston, and Livingston rose rapidly, and spillways went into operation.

Atascocita Area on Lake Houston (Photo: HCFCD)
The Lake Livingston discharge reached a maximum of 110,600 cfs. The maximum lake level was 134.38 ft, 3.38 feet above the normal pool elevation of 131.00 ft. All this despite that the storm affected only the lower portion of the watershed! (Images: USGS, TRA)
Lake Conroe Division Systems Manager Ike Barrett arrived at the Lake Conroe dam early on the morning of October 17 to find the lake level approximately two feet above the tops of the tainter gates. Barrett immediately ordered the gates to be opened to prevent damage.

Lake Conroe reached a maximum level of 205.88 feet (4.88 feet above the normal conservation pool of 201.00 ft). A peak discharge of 56,000 cfs was recorded a short distance downstream of the dam. (Photo: SJRA)
The Lake Houston discharge reached a maximum value of 359,000 cfs with a corresponding lake elevation of 52.8 feet, 8.3 feet above the crest elevation of the 3,160-foot long overflow spillway. (Photo: HCFCD)

Rivers and Creeks Rise
Cypress Creek overflowed its banks, sending thousands of acre-feet of storm water cross-country to the Addicks and Barker Reservoir watersheds and inundating thousands of acres of land. (Photo: HCFCD)

(Photo: HCFCD)
Maximum flood levels along Spring Creek exceeded FEMA 1% annual chance values by 4.0 to 4.5 feet. The Northgate Crossing levee was overtopped on October 18, 1994. This is one of only two levee systems in Harris County. (Photo: HCFCD)

Stream flows in excess of 1% annual chance values were recorded at 19 USGS gages within the affected area! New historical maxima were recorded at 25 of 43 stations!
The 1994 flood produced peak flows on the San Jacinto and Lavaca Rivers that exceeded historical maxima from much larger watersheds.

Pea Gravel is found everywhere. Although this small stone is used primarily in gardening, co-author Andy Yung will always associate it with the massive flood of 1994!
Breakage of pipelines across the river led to a fire that sent plumes of black smoke hundreds of feet into the air. (Photo: Houston Chronicle)
San Jacinto River Shortcut across Banana Bend/Rio Villa Meander. This is near the location of exposed pipelines; note burned trees. (Photo: HCFCD)
Conclusions

- Extreme rainfall events will continue to occur.
- Are they “acts of God” that may be ignored, or should they be considered when establishing flood protection requirements?
- The adoption of criteria that exceed FEMA minimum requirements should be considered by communities to guard against severe events.
- Design of critical facilities should consider such extreme events.
- We must study and learn from these events.
- Improvements in predictive technology and warning systems must continue in order to reduce the loss of life that occurs during such extreme weather events.
