MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Liberty County, Texas
 Survey Area Data: Version 19, Jun 11, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 6, 2017—Oct 28, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
AtaC	Atasco fine sandy loam, 2 to 5 percent slopes	D	98.6	3.9%
BisA	Bissonnet loam, 0 to 1 percent slopes	C/D	14.8	0.6%
LelA	Lelavale silt loam, 0 to 1 percent slopes, frequently ponded	C/D	82.9	3.2%
PlaA	Plank silt loam, 0 to 1 percent slopes	D	59.1	2.3%
SegB	Segno fine sandy loam, 1 to 3 percent slopes	B	81.4	3.2%
SosA	Sorter-Tarkington complex, 0 1 percent slopes	B/D	34.4	1.3%
SplB	Splendora fine sandy loam, 0 to 2 percent slopes	D	392.9	15.4%
WalA	Waller silt loam, 0 to 1 percent slopes	C/D	24.1	0.9%
WatA	Waller-Tarkington complex, 0 to 1 percent slopes	D	816.1	31.9%
WesA	Westcott very fine sandy loam, 0 to 1 percent slopes	B/D	622.6	24.4%
WetA	Westcott-Plumgrove complex, 0 to 1 percent slopes	C/D	328.9	12.9%
Totals for Area of Interest			2,555.9	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition
